Business Insights & Recommendations

Jan–Dec 2023 | 2,330 tickets across 12 countries | Built with Excel, MySQL and Power BI

Scope & Approach

I cleaned the raw ticket data in Excel using Power Query, built a star schema in MySQL, and created the dashboard in Power BI. The analysis is built around 8 business questions — things like SLA performance, channel efficiency, First Contact Resolution, and agent CSAT — and each one has its own SQL query in the project folder.

Executive Summary

This report looks at 2,330 support tickets from 2023, across 12 countries. Overall, the numbers are decent: just over 80% of tickets are resolved within SLA, and the average customer rating is 3.51 out of 5. But a closer look shows where things are breaking down — a few ticket types get most of the volume, one channel is much slower to respond, and most agents aren't hitting their CSAT goal.

Key Insights

Most tickets come from just three categories — Product Setup, Pricing & Licensing, and Feature Requests together make up about 7 out of every 10 tickets. These are the best place to start if the goal is fewer tickets overall.

Urgent tickets are missing deadlines too — About 1 in 4 High-priority Training Request tickets miss their SLA deadline, and about 1 in 4 High-priority Purchasing & Invoicing tickets do too. That's worse than these categories usually perform — which is a problem, since these are the tickets that are supposed to be handled fastest.

Email replies take too long — Email gets the most tickets of any channel, but it takes about 48 minutes to send the first reply. Chat replies in under 2 minutes. That's a big gap for the busiest channel.

Solving it fast doesn't always mean a happier customer — Tickets solved on the first contact don't consistently get better CSAT scores than tickets that took longer. In several categories, the scores end up about the same either way.

Recommended Actions

- Add self-service guides for the top 3 ticket categories first, since that's where most of the volume comes from.
- Fix the escalation process for High-priority Training Request and Purchasing & Invoicing tickets.
- Set up better routing and auto-replies for Email so first response time gets closer to Chat's.
- Judge performance using CSAT, SLA, and resolution time together — not First Contact Resolution alone.

Bottom Line

The easiest wins here aren't about working harder across the board. They come from fixing three specific things: where most tickets are coming from, how urgent tickets get handled, and how fast Email replies to customers.
